

Amendments To The Claims:

1. (Currently amended) A polishing composition for polishing an object having a portion including silicon dioxide and a portion including polycrystalline silicon, the polishing composition consisting of water and water-soluble amine, wherein the water-soluble amine is comprises at least one of triethylenetetramine and tetraethylenepentamine and is dissolved in the water, and wherein the content of the water-soluble amine in the polishing composition is between about 3 to 10% by weight.

2. (Canceled)

3. (Canceled)

4. (Canceled)

5. (Original) The polishing composition according to claim 1, wherein a selection ratio, which is the ratio of the ability to polish silicon dioxide to the ability to polish polycrystalline silicon, of the polishing composition is 100 or more.

6. (Withdrawn – Currently Amended) A method for polishing an object having an insulating film including silicon dioxide and a conductive film including polycrystalline silicon, with the insulating film having a surface including a trench, and the conductive film being located on the insulating film and having an inner portion located inside the trench and an outer portion located outside the trench, the method comprising the steps of:

preparing a polishing composition, wherein the polishing composition consists of water and water-soluble amine, and wherein the water-soluble amine is comprises at least one of triethylenetetramine and tetraethylenepentamine and is dissolved in the water, wherein the content of the water-soluble amine in the polishing composition is between about 3 to 10% by weight; and

polishing the object using the polishing composition to remove the outer portion of the conductive film.

7. (Withdrawn) The method according to claim 6, wherein the step of polishing the object using the polishing composition to remove the outer portion of the conductive film, includes compressing the object and a polishing pad against one another, and rotating the object and the polishing pad in directions opposite to each other while supplying the polishing composition to the polishing pad, wherein the pressure for compressing the object and the polishing pad against one another is 3.5 to 58 kPa.

8. (Withdrawn) The method according to claim 6, wherein the step of polishing the object using the polishing composition to remove the outer portion of the conductive film, includes compressing the object and a polishing pad against one another, and rotating the object and the polishing pad in directions opposite to each other while supplying the polishing composition to the polishing pad, wherein the relative linear speed between the object and the polishing pad during polishing is 30 to 100 m/min.

9. (Withdrawn) The method according to claim 6, wherein the step of polishing the object using the polishing composition to remove the outer portion of the conductive film comprises the sub-steps of:

- removing part of the outer portion without using said polishing composition; and
- polishing the object using said polishing composition to remove the remaining part of the outer portion.

10. (Withdrawn) The method according to claim 9, wherein the sub-step of removing part of the outer portion without using said polishing composition comprises removing silicon dioxide, which is formed by oxidation of polycrystalline silicon, on the surface of the conductive film.

11. (Withdrawn) The method according to claim 10, wherein said removing silicon dioxide is performed by dissolving the silicon dioxide using hydrofluoric acid.

12. (Withdrawn – Currently Amended) A method for manufacturing a semiconductor device, the

method comprising the steps of:

preparing a polishing composition, wherein the polishing composition consists of water and water-soluble amine, and wherein the water-soluble amine ~~is comprises~~ comprises at least one of triethylenetetramine and tetraethylenepentamine and is dissolved in the water, wherein the content of the water-soluble amine in the polishing composition is between about 3 to 10% by weight;

preparing a semiconductor substrate having an insulating film including silicon dioxide;

forming a trench on the surface of the insulating film;

forming a conductive film including polycrystalline silicon on the insulating film to

prepare an object having the insulating film and the conductive film, with the conductive film located on the insulating film and having an inner portion located inside the trench and an outer portion located outside the trench; and

polishing the object using the polishing composition to remove the outer portion of the conductive film.

13. (Canceled)

14. (Canceled)

15. (Canceled)

16. (Canceled)

17. (New) The polishing composition according to claim 1, wherein the water-soluble amine is tetraethylenepentamine.

18. (New) The polishing composition according to claim 1, wherein the water-soluble amine is triethylenetetramine and tetraethylenepentamine.
